

Species abundance & diversity

Now it gets interesting...

Lecture outline

- Community characteristics
 - Physical structure
 - Biological structure
- Biological structure
 - Abundances
 - Dominance
 - Diversity
- Disturbance
 - Characteristics
 - Intermediate Disturbance Hypothesis
 - A human-caused example

Mt. Rainier NP, Nat. Geo.

What's a community?

- ??
- vs. assemblage?
- vs. guild?
- vs. ecosystem?

Characterizing communities

- Physical structure
 - Both biotic and abiotic
- Biological structure (=community structure)

"the x-axis"

"the y-axis"

Physical vs. biological structure

Biological/Community structure

- Abundances
- Dominance
- Diversity

Abundances

- The lognormal distribution (Preston 1948)

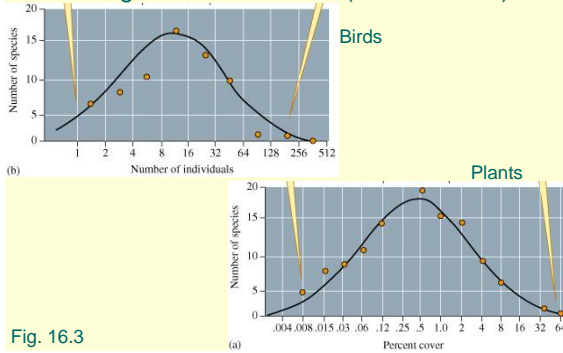

Fig. 16.3

Dominance

- How do you tell?
- Relative abundance
- Relative dominance
- Importance value

Diversity

- Two components:
 - _____ and _____
- Many formulas to calculate diversity based on these two components, each with varying degrees of success

5 species...equal diversity? Fig. 16.5

A diversity index

- Shannon-Wiener Index:
 - $H' = -\sum p_i \log_e p_i$
 - Increases as ? and ? increase
 - Derived from information theory

Shannon-Wiener Index example

Table 16.1
Calculating species diversity (H') for two hypothetical communities of forest trees

Community a				
Species	Number	Proportion (p_i)	$\log_e p_i$	$p_i \log_e p_i$
1	21	0.84	-0.174	-0.146
2	1	0.04	-3.219	-0.129
3	1	0.04	-3.219	-0.129
4	1	0.04	-3.219	-0.129
5	1	0.04	-3.219	-0.129
Total	25	1.00		-0.662

$$H' = -\sum_{i=1}^5 p_i \log_e p_i = 0.662$$

Community b				
Species	Number	Proportion (p_i)	$\log_e p_i$	$p_i \log_e p_i$
1	5	0.20	-1.609	-0.322
2	5	0.20	-1.609	-0.322
3	5	0.20	-1.609	-0.322
4	5	0.20	-1.609	-0.322
5	5	0.20	-1.609	-0.322
Total	25	1.00		-1.610

$$H' = -\sum_{i=1}^5 p_i \log_e p_i = 1.610$$

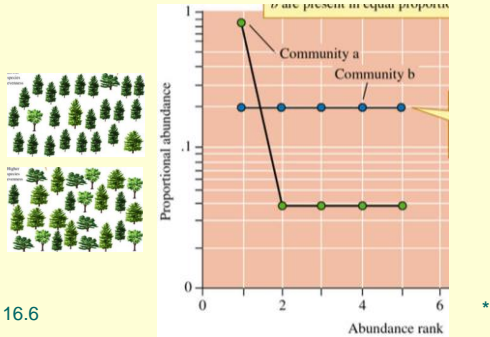

Issues with diversity indices

- $H' = 1$ here, = 3 there...celebrate or not?
- $H' = 3$ now, = 2 later...why?
- Also:

A picture of species diversity

Rank-abundance curves

What controls species diversity?

- Resources?
- Competition?
- Predation?
- Many ecological models assume *stable* environmental conditions—an equilibrium—in order to answer this question
- Is this realistic?

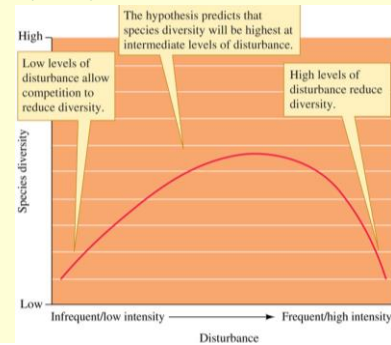

Disturbances

- = ?
- Characterized by
 - Intensity
 - Spatial scale
 - Frequency
 - Duration

Intermediate disturbance hypothesis

Poverty and Mortality Disparities in Central Appalachia: Mountaintop Mining and Environmental Justice

Michael Hendryx, PhD, West Virginia University
Conclusions. Persons living in MTM areas experience persistently elevated poverty and mortality rates. Higher mortality is independently associated with both poverty and MTM, the latter effect suggestive of a possible environmental contribution from mining activities. Efforts to reduce longstanding health disparities in Appalachia must focus on those areas where disparities are concentrated: the Appalachian coalfields.
