

### Important Themes in This Course

- Evolution and Natural Selection explain the unity and diversity of life
- Levels of organization in biology
- Emergent properties
- Structure follows function
- Cells make up all living things
  - Prokaryotic vs. eukaryotic cells
- Energy and energy flow in living things
- Heredity - information transfer between generations of cells and organisms

### Characteristics of Living Things

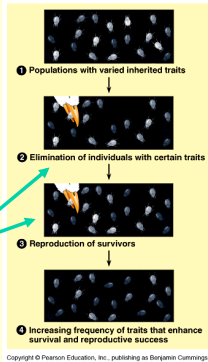

### Darwin's observations:

- 1. Organisms reproduce faster than necessary to replace themselves.

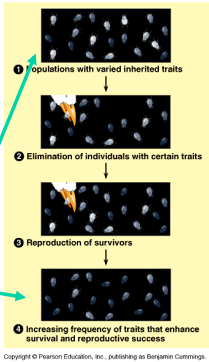

### Darwin's observations:

- 1. Organisms reproduce faster than necessary to replace themselves.
- 2. Organisms vary, and that variation is often inherited.
- 3. Some variants survive or reproduce better than others.

### Darwin Concluded:

- If only some variants survive and reproduce, then the next generation will resemble the successful variants.
- Populations will change, or evolve, over time.

### Origin of Species

- Lyell, a contemporary of Darwin, established the great age of the earth
- Given enough time, evolution by natural selection has produced the diversity of species we see today

## Importance of Evolution to Biologists

- 1. Because all living things are related (much evidence supports this conclusion), lessons learned in one species apply to others.
- 2. Adaptation through natural selection what made living things the way they are. Understanding that process puts biology in context. "Why" questions...
- T. Dobzhansky: "Nothing in biology makes sense except in the light of evolution."

(a) Cilia of *Paramecium*

(b) Cilia of windpipe cells

(c) Cross section of cilium showing structural similarity

**Species:** *Canis lupus*  
**Genus:** *Canis*  
**Family:** Canidae  
**Order:** Carnivora  
**Class:** Mammalia  
**Phylum:** Chordata  
**Kingdom:** Animalia

**Emergent Properties**

Molecule      Organelle      Cells

Tissues      Organ      Community

### How Many Kingdoms are There?

Bacteria
Archaea
Protista

Plantae
Fungi
Animalia

### Carl Woese and rRNA genes: a new view of similarities

- rRNA genes are present in all forms of life
- Very similar in close relatives
- Different in distant groups
- A tool for examining relatedness, independent of external form
- 16S rRNA changes very slowly

Carl Woese, microbiologist
